Possible Approach #1: Legendary Status

Possible Research Questions

- How will a pokemon's type1 and type2 to affect their legendary status?
- How will a pokemon's base stats affect a pokemon's legendary status?
- How does a pokemon's stats and type1 affect a pokemon's legendary status?

Making is_legendary categorical first

```
pokemon$is_legendary <- factor(pokemon$is_legendary,  
  labels = c("Not Legendary", "Legendary")  
)
```

How will a pokemon's base stats affect a pokemon's legendary status?

```
ggplot(data = pokemon, mapping = aes(x = attack, y = is_legendary)) +  
  geom_boxplot()
```

```
ggplot(data = pokemon, mapping = aes(x = defense, y = is_legendary)) +  
  geom_boxplot()
```

```
ggplot(data = pokemon, mapping = aes(x = hp, y = is_legendary)) +
  geom_boxplot()
```

```
ggplot(data = pokemon, mapping = aes(x = speed, y = is_legendary)) +  
  geom_boxplot()
```

Interactive Model

Nested F-test

How will a pokemon's type1 and type2 to affect their legendary status?

This bar plot is definitely wrong but idk how to fix it

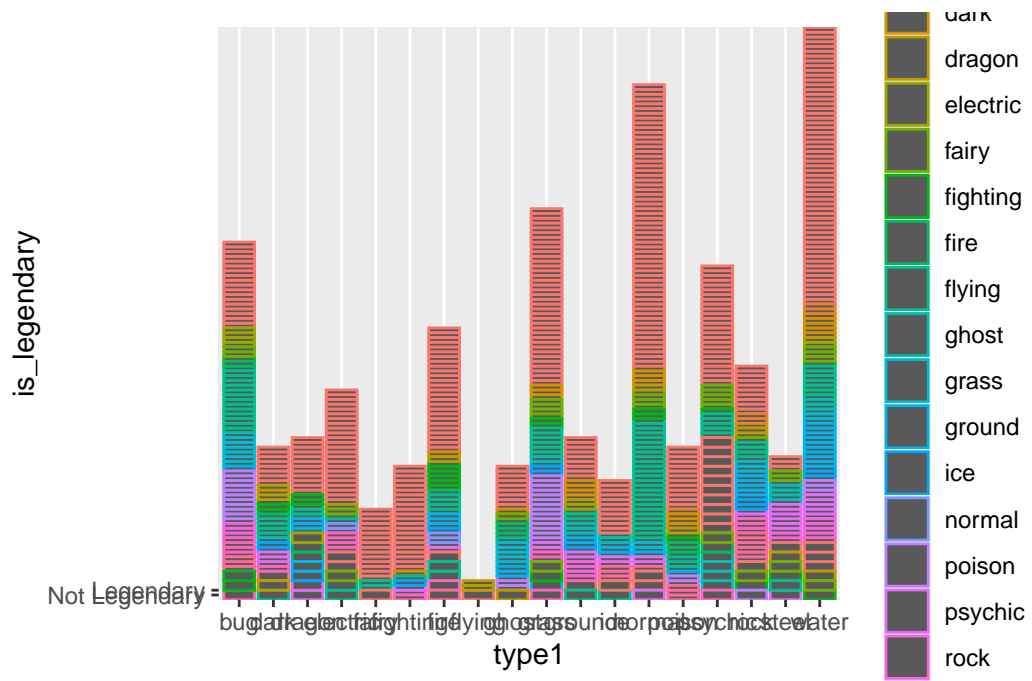

```
ggplot(data = pokemon, mapping = aes(x = type1, y = is_legendary)) +  
  geom_col()
```

```
ggplot(data = pokemon, mapping = aes(x = type2, y = is_legendary)) +  
  geom_col()
```

```
ggplot(data = pokemon, mapping = aes(x = type1, y = is_legendary, color=type2)) +
  geom_col()
```

```

pokemon <- mutate(pokemon, duel_type = if_else(!is.na(type2) & !is.na(type2), "duel type",

pokemon <- mutate(pokemon, duel_type = !is.na(type1) & !is.na(type2))

# pokemon <- mutate(pokemon, duel_type = if_else(type2 = NA, TRUE, FALSE))

pokemon <- mutate(pokemon, duel_type = grepl(pattern = "", type2, ignore.case = TRUE))

pokemon <- mutate(pokemon, duel_type = grepl(pattern = NA, type2, ignore.case = TRUE))

unique(pokemon$'duel_type')

```

Possible Approach #2: Capture Rate

Possible Research Questions

- How do different pokemon's base stats influence capture rate?
- How do a pokemon's type 1 and type 2 affect capture rate?
- How do a pokemon's type 1, and base stats affect its capture rate?

How do a pokemon's type 1 and type 2 affect capture rate?

```
pokemon$'capture_rate' = as.numeric(pokemon$'capture_rate')
```

Warning: NAs introduced by coercion

```
pokemon$'type1' = as.factor(pokemon$'type1')  
pokemon$'type2' = as.factor(pokemon$'type2')
```

Fix barplots since they are definitely wrong

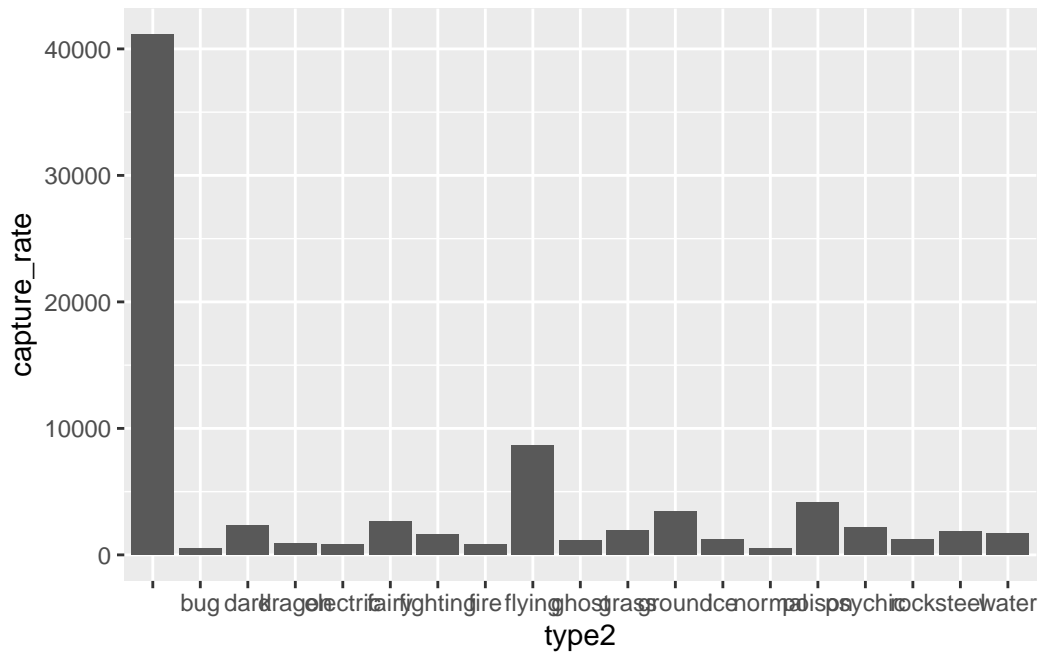

```
ggplot(data = pokemon, mapping = aes(x = type1, y = capture_rate)) +  
  geom_col()
```

Warning: Removed 1 rows containing missing values (position_stack).

```
ggplot(data = pokemon, mapping = aes(x = type2, y = capture_rate)) +
  geom_col()
```

Warning: Removed 1 rows containing missing values (position_stack).

```
ggplot(data = pokemon, mapping = aes(x = type1, y = capture_rate, color=type2)) +
  geom_col()
```

Warning: Removed 1 rows containing missing values (position_stack).

```
ggplot(data = pokemon, mapping = aes(x = type1, y = capture_rate)) +
  geom_boxplot()
```

Warning: Removed 1 rows containing non-finite values (stat_boxplot).

```

1	764	4168465				
2	634	3616666	130	551799	0.7441	0.9807

The p-value is higher than 0.05 meaning we can go with the additive model in this case. The adjusted r-square is also higher in the additive model, meaning that it would be better to, use the additive model if we go with this question.

Opinion: Since the additive model seems to look better, for analysis on the EDA we should focus on this. There are a lot of variables, so analyzing them may be difficult, but possible.

How do different pokemon's base stats influence capture rate?

Stats

- attack
- base_happiness
- base_egg_steps
- base_total
- defense
- hp
- sp_attack
- sp_defense
- speed The base stats I'll focus on are attack, hp, defense, and speed. I'm not sure what are important base stats for pokemon but I'm guessing.

The p-value is below 0.05 implying that the change from additive to interactive is necessary, but I feel like the adjusted r-square doesn't justify the change.

Opinion: Would be interesting to look at but haven't tested removing some explanatory variables to see how it affects the model.

p-value is less than 0.05 so maybe going with the interaction model will help and the adjusted r-squared has enough of an increase to consider it.

Opinion: Definitely a bit messy with my visualizations but again will have a hard time analyzing all the variables in the equation and the model.
